- MTM
- Regulatory Reporting

Data Integration and Analysis

- Data Quality
- Transparent, Accountable and Scalable Architecture
- Patient/Provider Alignment Across Enterprise
- Transformation to Standard Architecture

IMI Health has developed a proprietary Integrated Health Decision Support System (IHDS) to support consulting as a core business. IMI Health addresses the lack of actionable information in healthcare, especially in the areas of quality, transparency, value and care facilitation. IMI Health can build the necessary foundation for cost containment and value-based care by ensuring that investments in healthcare IT are effective and making the best use of comparative effectiveness research and meaningful health and wellness interventions. Healthcare stakeholders are looking to better demonstrate the value they provide to their customers. They have complex operating environments that present unique challenges when consolidating information to generate a single version of the truth. Even so, business Intelligence efforts are not enough to create the efficiencies demanded by the marketplace. IMI Health's solutions provide customers with the technology to transform the administrative infrastructure and information flow within their organizations, streamlining multiple processes and supplying the foundation for operational business intelligence and that includes intuitive applications with built in real-time reporting and analytics.

At the core of IMI Health Business Intelligence Suite are the following:

- Medical Management
- Compliance
- Data Integration and Analysis

IMI Health has executed best-of-breed data management processes and business intelligence technologies on healthcare data. Proactive data management is fundamental to the IHDS platform, tools and utilities. The ability to maintain the context or meaning of the data within a framework is a key differentiator. Consequently, the quality of the data is much higher than most which is paramount for success of any intelligence implementation. IHDS provides the framework from which the company's core solutions have been built, all of which continue to evolve as IMI Health listens and responds to its customers and the marketplace.

Medical Management

Providers and payers need to create best practices for compensation and clinical care while at the same time individuals need support for making better choices as patients and consumers. IMI Health can be a linchpin to create accountability for lower-cost, high quality care by

working with health plans, employer groups and unions, physician practices, pharmacy benefit managers and health systems. Businesses know they need the right information when they need it to make the best possible business decisions. Information management must lead to business enablement. Companies are dealing with more data and information than ever and want it real-time.

Compliance

A critical flaw in American health delivery today is the lack of accountability for costs and results. Providers, patients, insurers, employers and government entities all participate in a system with little incentive or sometimes even adverse financial consequences, to improve quality and reduce overall costs. Transitioning to a system of greater accountability will require greater flexibility for private and public stakeholders to experiment with programs and measure results to see what works best. IMI Health is committed to bringing inspiration and innovation to healthcare through data by making healthcare data, information and knowledge accurate, relevant, accessible and transformational.

Data Integration and Analysis

IMI Health uses a stable of subject matter experts (SME's) to direct and assist with technology solutions and product development. IMI Health enhances its solution offerings and capabilities with these talented experts who understand the healthcare industry and can translate data needs into data availability and data liquidity. IMI Health's unique blend of people and processes ensure that technology solutions are appropriately developed and delivered to stakeholders.

IMI Health's business model is founded on the requisite principles for becoming the most successful healthcare data technology provider serving the healthcare industry. Initially focused on HEDIS and Medicare processes, the company has in the past and will continue to earn revenue for delivering significant value to those players who purchase its solutions and services. Central to IMI Health's value proposition are cost reductions associated with removing current inefficiencies in existing processes and opportunities created from increased transparency and quality of data.
